Education

Rice University

Bachelor of Science in Computer Science

May 2024

Houston, TX

Relevant Experience

Stripe

August 2024 - Current

Software Engineer II

- Built and own the canonical system for identifying merchants affected by user-facing incidents, now the system of record for customer impact on over **50%** of user-facing incidents and more than **70%** of severe incidents.
- Delivered the full stack behind it: a backend for processing merchant impact data, Slack integrations surfacing reports in incident channels, and a React app for incident responders. Incidents using the tool during active response notified impacted users **40%** faster.
- Designed and built a self-serve query platform from scratch, including a template DSL and a React authoring UI, replacing a ticket-based integration process that took weeks per incident shape.
- Expanded incident impact tooling from 5 hardcoded report types to **130+** templated types authored by **50+** teams across both LogScale and Trino SQL backends; roughly **10%** of Stripe's service-driven user-facing incidents now receive impact reports automatically at incident open.
- Led migration of incident impact infrastructure to LogScale under a hard deprecation deadline, building a new query client from scratch and translating **28** existing report types into LogScale's query language.
- Verified migration output parity by shadowing live user-triggered reports against both backends, then cut over with **zero downtime** and no loss of reporting coverage.
- Mentored **3** new hires from onboarding through code and design review, and served as intern manager for a summer intern, owning project scoping, feedback, and performance evaluation.

IBM

May 2023 - August 2023

Backend Development Intern

- Designed and developed a streaming pipeline in Scala using Apache Spark to ingest and process Apache Kafka data, providing real-time data to end users while handling up to **a million files per day**.
- Implemented schema inference and validation to route missing and nested data across **300+** SQL tables.
- Automated Docker image security remediation and deployment on IBM Cloud, reducing security-fix turnaround from weeks to hours.
- Enhanced job monitoring within internal documentation, giving developers up-to-date information on running production jobs and speeding up issue resolution.

Chevron

May 2022 - August 2022

Software Engineer Intern

- Built metadata extraction pipelines over **millions** of unstructured engineering documents, producing the first queryable inventory of an archive that business units previously had no reliable way to search.
- Used Databricks and Apache Spark to hold performance steady as extraction scaled across the full document corpus.

Rice Apps

June 2022 - May 2023

Full Stack Developer

- Built a campus event registration and volunteer management platform with Next.js and Supabase on a team of student developers, replacing a manual, spreadsheet-driven process.
- Developed the registration page used by event organizers, supporting attendee CRUD plus search and filtering to manage signups at event scale.
- Implemented an analytics dashboard charting registration trends and live attendance, giving organizers visibility during events and for future planning.

Technical Skills

Languages: Ruby, TypeScript, Python, Java, Scala, SQL, HTML/CSS

Frameworks: React, Next.js, Apache Spark

Data & Infrastructure: Git, Splunk, LogScale, Grafana, Kafka, Docker, Git
