Education

Rice University

Bachelor of Science in Computer Science

May 2024

Houston, TX

Relevant Experience

Stripe

August 2024 - Current

Software Engineer II

- Own the system Stripe uses to determine which merchants were affected by user-facing incidents, serving as the **canonical record of customer impact** for over **50%** of user-facing incidents and more than **70%** of severe incidents. Spans the backend for processing merchant impact data, Slack integrations surfacing reports in incident channels, and a **React** app for incident responders; incidents using the tool during active incident response notified impacted users **40%** faster.
- Designed and built a **self-serve query platform** from scratch, including a **template DSL** and a React authoring UI, replacing a ticket-based integration process that took weeks per report type. Expanded Stripe's incident impact tooling from 5 hardcoded report types to **130+** templated report types authored by **50+** teams, with support for both **LogScale** and **Trino SQL** backends; **~10%** of Stripe's service-driven user-facing incidents now receive impact reports automatically at incident open.
- Led migration of Stripe's incident impact reporting infrastructure to **LogScale** under a hard deprecation deadline, building a new query client from scratch and translating **28** existing report types to LogScale's query language. Verified output parity by shadowing live user-triggered reports and cut over with **zero downtime** and no loss of reporting coverage.
- Mentored **3** new hires from onboarding through code and design review, and served as **intern manager** for a summer intern, owning project scoping, feedback, and performance evaluation.

IBM Corporation

May 2023 - August 2023

Backend Development Intern

- Designed and developed a streaming pipeline in **Scala** using **Apache Spark** to efficiently ingest and process **Apache Kafka** data, providing real-time data for end-users while handling up to a million files per day.
- Implemented robust schema inference and data validation mechanisms within pipeline to extract and route data to any of more than three hundred **SQL** tables even with missing or nested data.
- Automated process of rebuilding and redeploying vulnerable software images by leveraging **Docker** and **IBM Cloud**, reducing time for security fixes from weeks to hours.
- Enhanced job monitoring feature within internal documentation giving developers up-to-date information on running production jobs, resulting in improved productivity and faster issue resolution.

Chevron Corporation

May 2022 - August 2022

Software Engineering Intern

- Created internal database scrapers for large-scale data aggregation and inference for use by Chevron business units in making operational decisions.
- Wrote scripts in **Python/Pandas** and **Java** to extract and aggregate information from technical engineering documents in order to uncover data about document life cycles, relations, and history, using **PostgreSQL** to pull data.
- Leveraged the use of **Databricks** and **Apache Spark** in order to maintain performance when scaling to analyzing millions of files.

Rice Apps

June 2022 - May 2023

Full Stack Developer

- Collaborated with a team of developers to develop a web app built with **Next.js** and **Supabase** aimed at streamlining the public party registration and volunteer management process at Rice.
- Spearheaded the creation of a user-friendly registration page that allowed seamless addition, removal, and updating of attendee information, while incorporating search and filtering functionalities for efficient registration management.
- Implemented an analytics dashboard, showcasing charts displaying registration data and a real-time attendance graph in order to provide valuable insights for monitoring and future event planning.

Technical Skills

Languages: Ruby, TypeScript, Python, Java, Scala, SQL, HTML/CSS

Technologies/Frameworks: Git, React, Apache Spark, Next.js, Node.js
